3. Post-match analysis

3.1 Analysis of own behaviours (self-analysis) and the opponent's

Context

A football team is an open, dynamic system, that is to say, it affects and is affected by its surrounding and develops through time.

For this reason, self-assessment, in terms of hits and misses, is a qualification of quantitative data and strategic circumstances, which have come up during the last disputed match and may leave a mark in the collective feeling of the team, and in each individual member - a team is a non-linear system.

This type of post-match analysis attests of the surrounding environment on our play, the opponent's, the moment-specific competitive conditions, and the consequences of victory and defeat.

The specific assessment of our own play together with the impact that the opponent has on our play provide a way to look at our team's immediate evolutionary process, starting from our expectations about the match, to the results we had, thus establishing the distance between the expected and the achieved.

Everything contextualized around the time of the game and the particular characteristics of the opponent we faced.

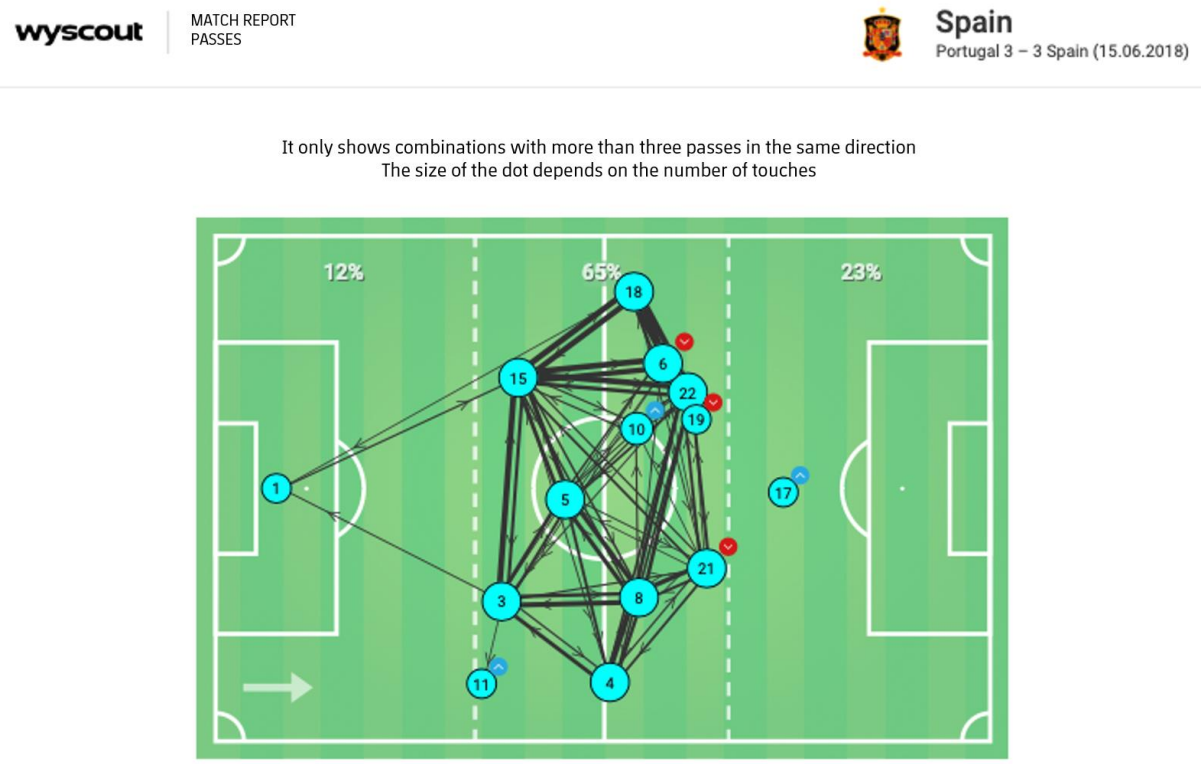

It is also necessary to reflect, at this point, on certain matters of our process of analysis in order to make it become a valuable tool for the improvement of the team. For example:

- If we agree that there could never be two equal situations in a match, is our analysis carried out following that viewpoint?
- If we intend that training prepares us for an unpredictable environment, why do we regularly provide predictable, stable situations during trainings?
- Is the affective factor - collective or individual - considered when analysing the game? This is constantly present, and it conditions everything: it can modify, diminish or enhance certain behaviours.
- Do we have the emotional skills necessary to face certain situations? For example:
    - When there is a goal for during the first minutes, it enhances our confidence;
    - When there is a goal against during the first minutes, it feels like the match is going to be uphill;
    - When we have to change the scoreboard or when we were winning but the other team changes it;
    - When certain environmental factors change our play;
    - Among others.
- In what ways are these tools reflected in our system of play?

- When we prioritize the system of play/ match plan instead of following our emotions
- When we prioritize following our emotions instead of the system of play/ match plan;
- When we anticipate emotional situations in the system of play/ match plan.

- Are we aware of the fact that what we observe is done so through our own viewpoint, knowledge, perspective, emotions, beliefs, etc.?
- Do we facilitate the players' involvement in the process of analysis?

Figure 1: Match report Portugal-Spain World Cup

Source: Wyscout (Agile Sports Technologies, Inc. 2018).

Justification

The post-match analysis of our own team is usually the starting point of the contents to develop during the next micro cycle, which is why we need to know how to link both moments.

We think that in many occasions, this analysis is not given enough importance, and analysts tend to start analysing the next opponent right away.

Analysing and working on issues that took place during our last match helps us track the state of the team at that particular moment.

Leaving what happened completely in the past may result in us not having any control over those behaviours - be them positive or negative - since we have not paid enough attention to them. As a consequence, we will not know the reasons for the positive or the negative behaviours.

Knowing why we lost a match is the first step towards winning the next one, and knowing why we won will be the first step towards repeating that victory.

For these reasons, post-match analysis implies a process of 'gathering' everything that happened during the match.

Match analysis

- From the perspective of action: Technical hits and misses that have influenced the performance of the team are observed - ball losses, low percentages of passes, sots off target, difficulty at dribbles, etc.

- From the perspective of decision: Everything related to the specific - defensive or build-up - tactical aspect that serves as a clue on the finishing result of the match is analysed. Perceiving the game as a global whole and making sure that players achieve a holistic understanding of football is part of the coach's job. All the necessary data, reports and images for the team to understand the circumstances under which they act and the fact that their decisions have consequences on the team's quality, have to be provided from this perspective.

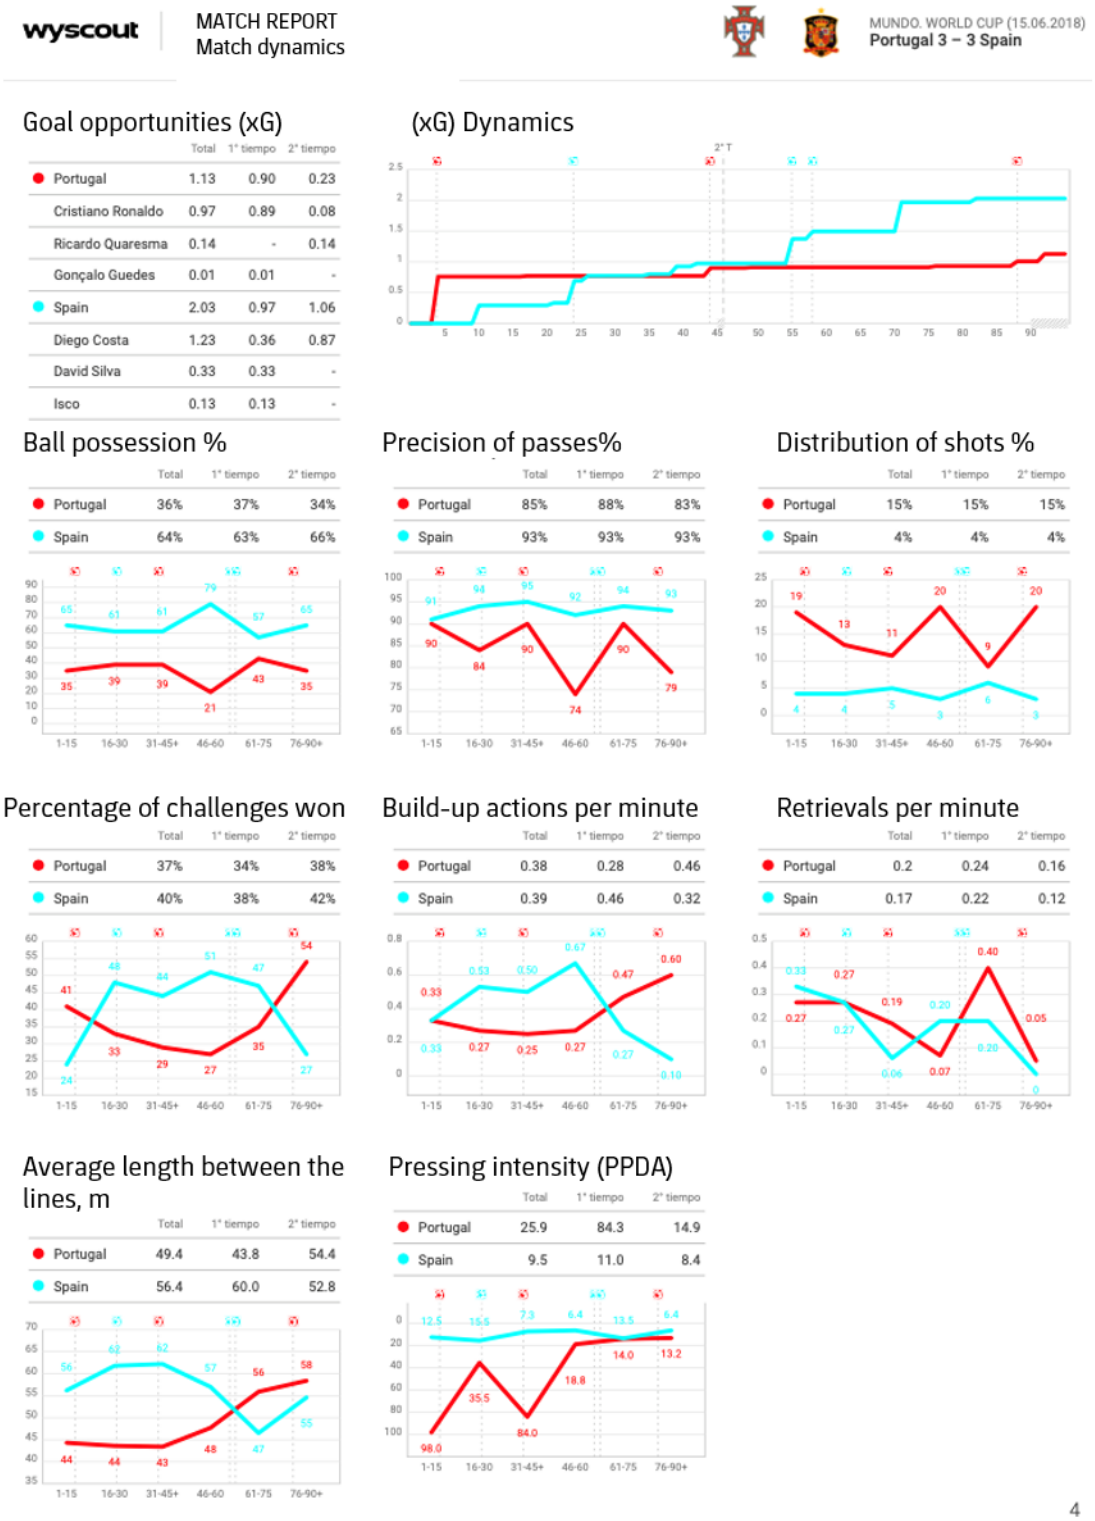

- From the perspective of the match plan designed and trained to face that match. In this analysis we will ask ourselves question like the following:

    - What did we do right?

We will take care of details later, but for now, knowing what we did right is very important in order to reinforce those behaviours and make players aware of them. Constructing, evolving and correcting from well-performed events will grant the team extra confidence and self-esteem.

This is why it is important to highlight the positive aspects observed during the match in the process of analysis and transmission of the post-match, especially if the result was not good and the team is emotionally discouraged.

Figure 2: Continuation of match report Portugal-Spain World Cup

Source: Wyscout (Agile Sports Technologies, Inc. 2018).

- What did we do wrong?

Taking into account the aspects we need to adjust is also a part of this process, but we need to manage this information and the way we transmit it carefully.

- What did we not do, that was part of the match plan?

This question entails a different type of analysis because there may be many reasons why the expected behaviours did not actually take place:

  - We did not know how to actually transmit those concepts. May it be due to the complexity of the message, the used tool, etc. This supposes a revision of the whole process.

  - The circumstances for the behaviours to actually happen did not occur. For example, in our plan we were supposed to press the opponent with a kick from the box because we had anticipated that the opponent would kick short most of the times. This did not happen during the match, so we were a little off balance. We should foresee that something like this could happen.

  - We lacked courage, will and commitment enough to keep up with this situation. Another example would be if we had been working during the week on pressure after a loss and the following vigilances on the part of our center backs after such episodes, and we are not able to put this into practice during the match.

  - Among others.

- How much of what was expected did we accomplish?

Apart from quantitatively analysing what we have accomplished in relation to what was expected, we need to get to the root causes of those results. In this sense, we should analyse:

  - How much of the accomplished is on our own merits?

  - How much of the accomplished is due to the opponent's weaknesses?

  - How much of what the opponent accomplished is on us?

  - How much of what the opponent accomplished is on their own merits?

- Which behaviours of the opponent can we counteract and which ones can we not?

It is possible that, even if we follow our match plan, we are not successful in some of the planned performances. Analysing the match taking this into account will be highly beneficial for future practices, since we will be able to reinforce certain behaviours and look for alternatives for some others. For example, let us imagine we are in the defence stage, and there is a 2vs2 on the wing. We had planned to face this with a change of opponent in the case of overlap on the part of the opponent. After the post-match analysis, we conclude that, although we acted as expected, we granted many center wingers in these types of situations. This will make us reconsider whether to change our defence in these situations, by modifying some aspect of the change of opponent, or by each player marking his own opponent until the end of the play (movement).

- From the perspective of efficiency:
  - Did we achieve our goals? (Yes/no, why?)
  - Did we win because we were efficient?
  - Did we win because the opponent has been less efficient?
  - Did we win due to a specific action?

Analysis of statistical data

Nowadays there are a lot of statistical data available for consultation, which doubtlessly will help us analyse what actually happened during the match.

However, it is important to be able to contrast our perception, assessment and feeling with statistical data in the post-match analysis. Sometimes, we may get to the wrong conclusions after the match observation. Contrasting my perception with certain useful data improves our assessment of the situation.

We can also carry out this process the other way around, starting from the statistical data and comparing them with the final result, or our conclusion based on the assessment carried out. These data may illuminate something that has been unnoticed in our previous analysis.

The way in which these data are presented has enormously evolved in the last few years:

- Events accounting: number of corners for/against, shots to the goal, attacking/defending free kick, goalkeeper's stops, etc.
- Percentage of ball possession, precise passes, completed passes, etc.
- Advanced metrics (multi variable analysis).

Next, we will see some examples.

In Figure 3 we can see some numerical data belonging to events and percentages. And in Figure 4 we can see very basic data together with a heat map.

Figure 4: Match data together with heat map that represents the areas through which L. Messi has passed during the match

Source: Mundo Deportivo, 2019, https://bit.ly/37kjc2u

Other types of data are the ones offered by advanced metrics, which can be defined as data that arise from a multi variable analysis, which means that they come from the interaction of various criteria.

Expected goals (xG) or (EXG) is one of the most broadly used concepts nowadays.

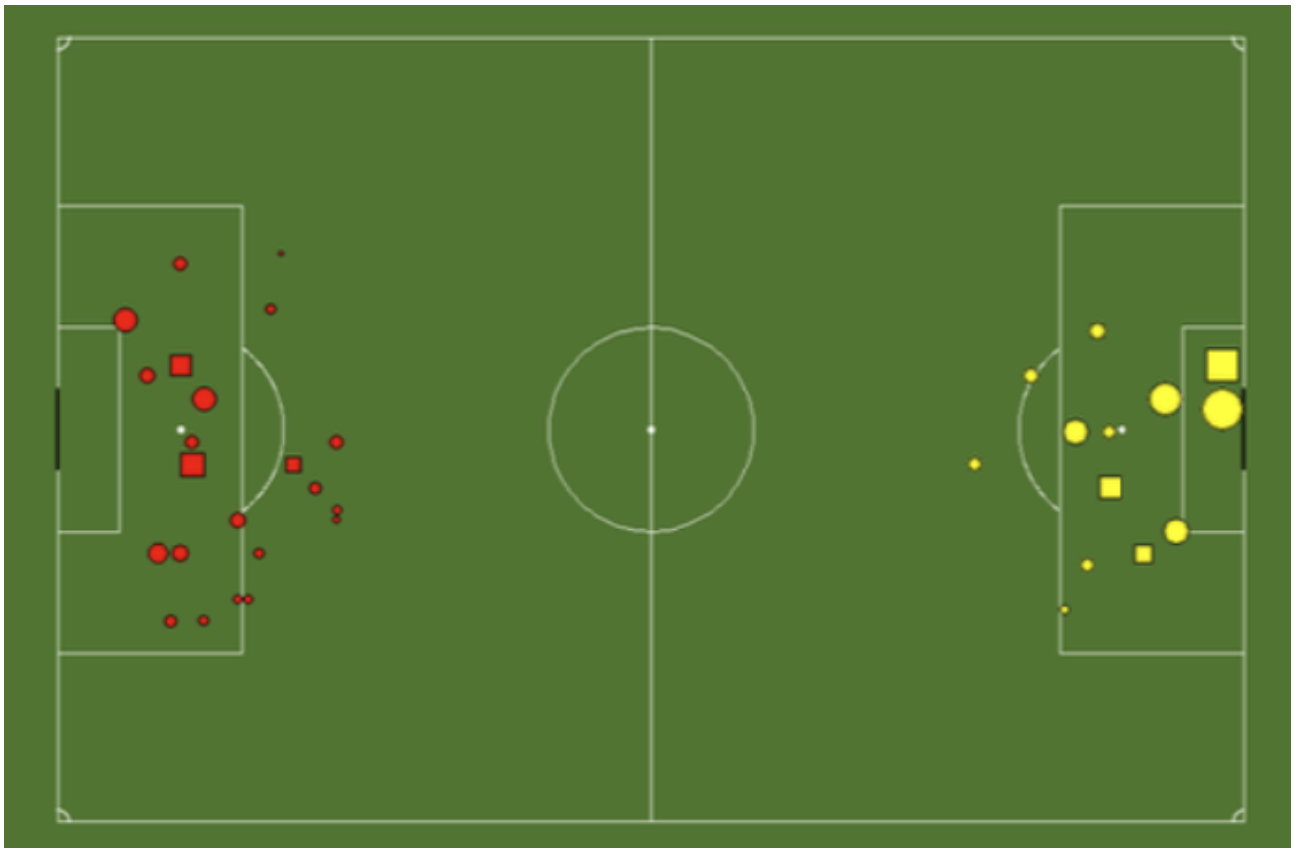

Expected goals (xG) is defined as the product between the addition of the total shots and the average chance quality: xG = nº of shots x (ACQ)

This average chance quality (ACQ) is calculated in relation to some factors:

- Distance from the box.
- Shot angle.
- Pressure on the shooter.
- Number of defenders between the ball and the box.
- Position of the goalkeeper.

Expected goals (xG) and ball movement points metrics (BMP) - developed by STATS LLC - are used to assess the effectiveness of each style of play.
The xG measures the probability of goal of a shot, in relation to the location of the kick and the type of finishing.
The xG assigns a quality value that varies from 0 to 1 for each shot at goal, with a higher value when the chance of scoring a goal is greater. For example, a head shot from a center position at the border of the box has a xG value of 0.3185.. In other words, 31.85% of the shots from that position end in goals.
In Figure 5 there is an example of xG values for all the shots of each team in a complete match. This model of xG is calculated using 31.384 shots of English Premier League (EPL) data from three seasons (2011-2012, 2012-2013, 2013-2014). This set the basis for the Expected Objectives model to calculate the probability that one shot results in goal. A detailed explanation of the xG model and multiple sources that develop this metric can be found in Rathke (2017). (Fernández Navarro, 2018. p. 92).

Figure 5: xG values for all the shots of each team in a complete match

Source: (Fernández Navarro, 2018. p. 93).

As has been mentioned before, data do not always correspond to reality in relation to the final result. Next, we will see two examples of matches where expected goals is clearly in favour of one of the teams. Actually, the numerical value obtained is the double.

In the first graphic (Figure 6), from the match San Lorenzo 0-2 Boca Juniors, we can see that expected goals can correspond with the final result, since San Lorenzo gets a xG of 0.74 and Boca Juniors of 1.52.

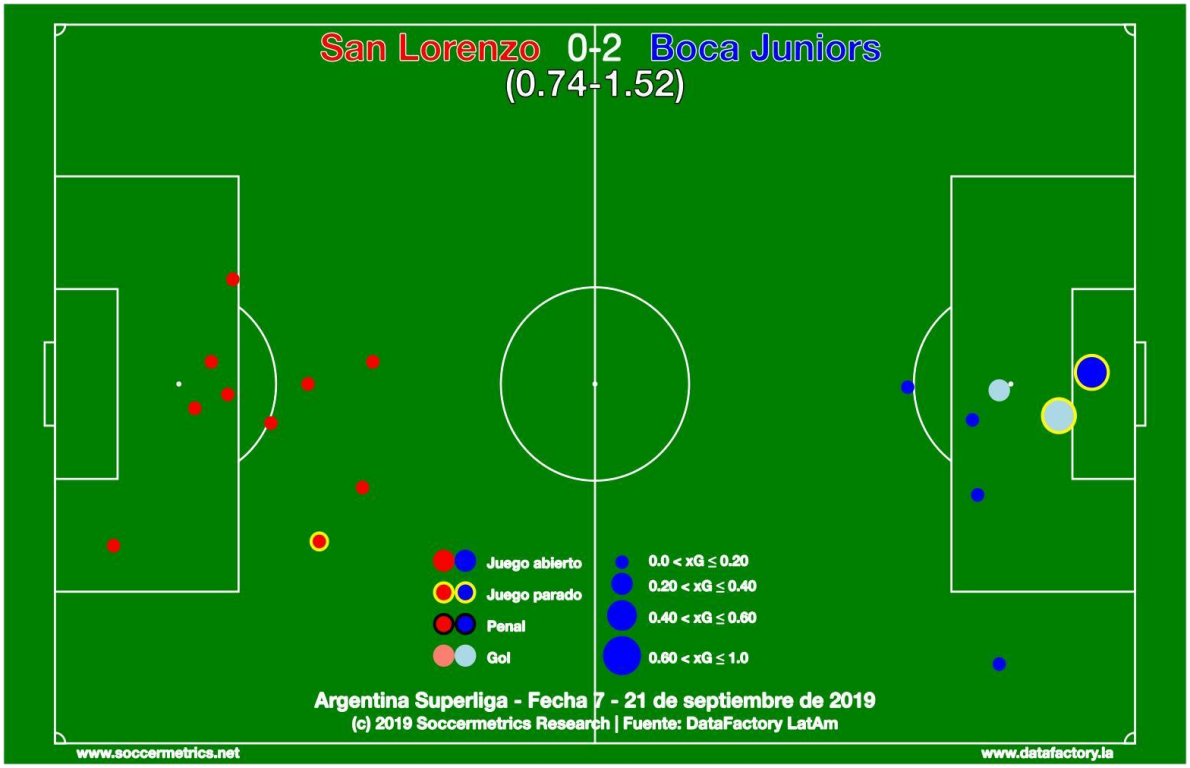

However, in the second graphic (Figure 7), the xG of the losing team (0.98) is twice the opponent's (0.48), which means that this data can induce us to mistakes.

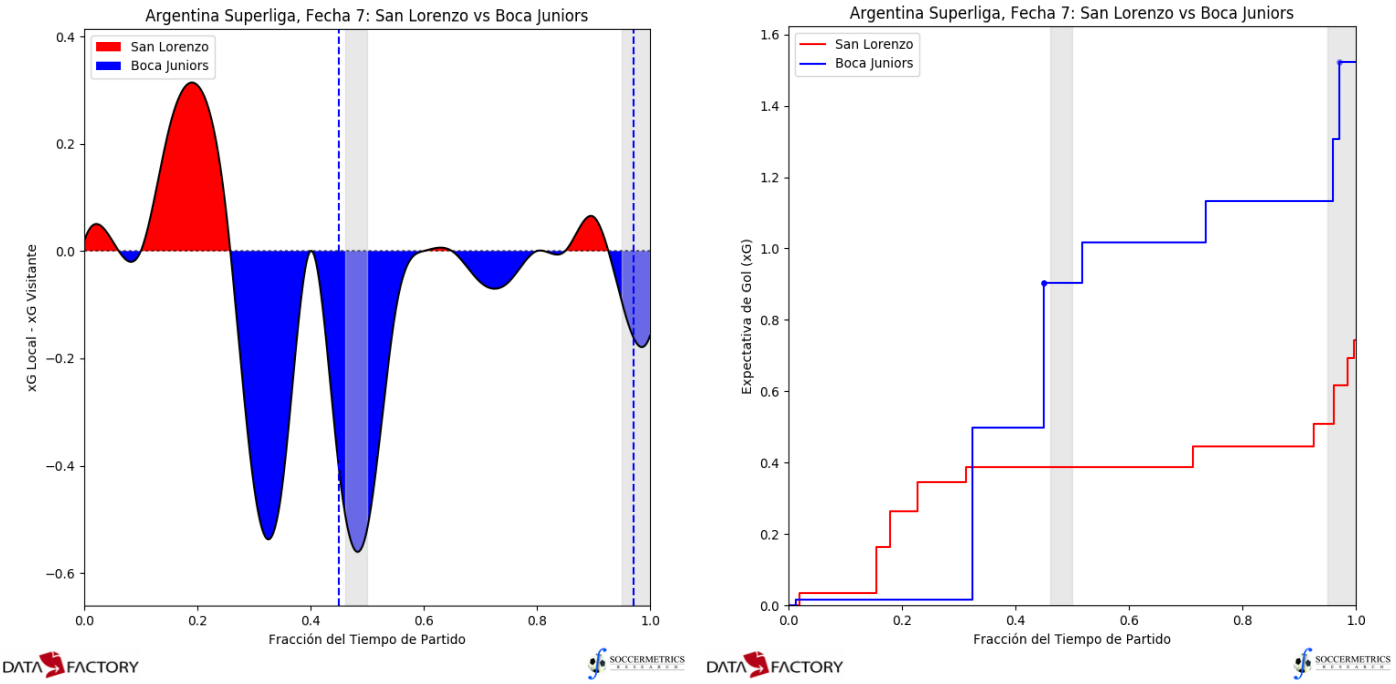

We can also see some other graphics where the following are shown:

- Both team's xG (in red and blue), in relation to the moments of the match.

- Both team's accumulated xG (in red and blue), in relation to the moments of the match.

3.2 What content do I transmit? When and in what ways do I do it?

Missed shots, goals and alternatives

The post-match analysis is a source of qualitative information that the player receives in order to broaden his perception of the complexity and diversity of the team he is a part of.

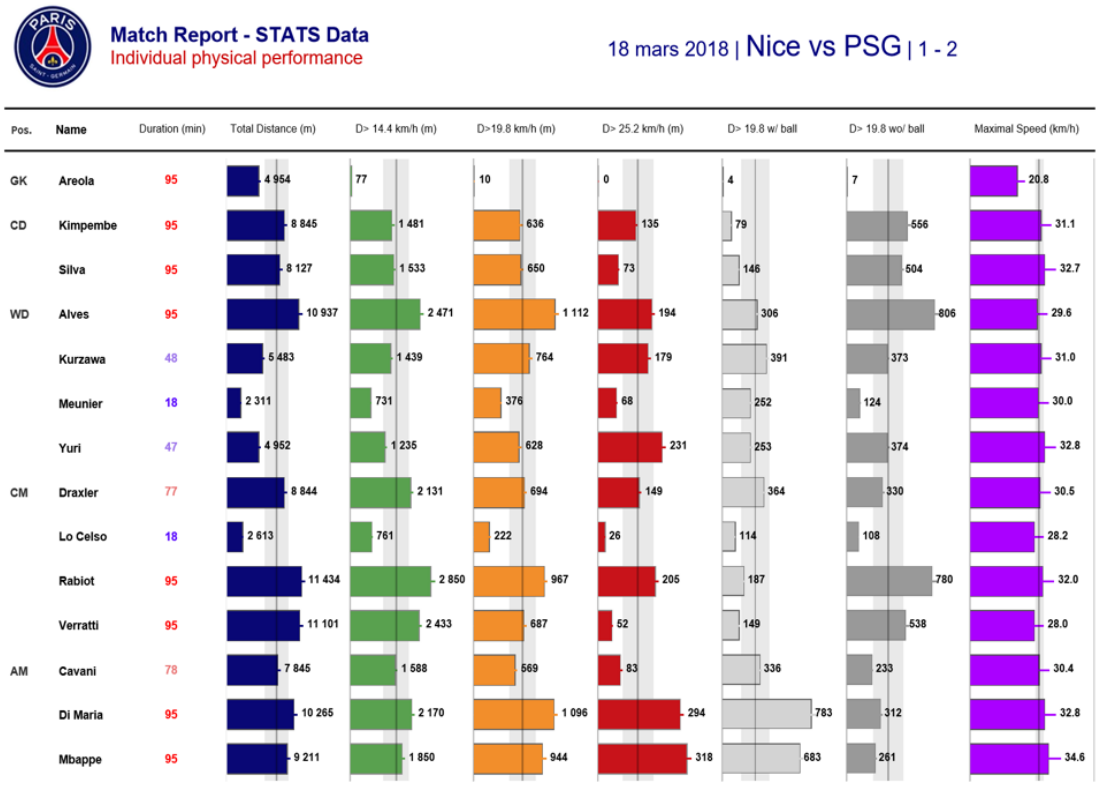

The main objective of this unit is to describe the transmission process of this post-match analysis to the players. If we want to make sure that the message transmission has the impact we wish it to have, we need to design a strategy.

To construct this strategy, we need to define certain aspects.

A. The nature of what I wish to transmit (missed shots, goals, alternatives, etc.).

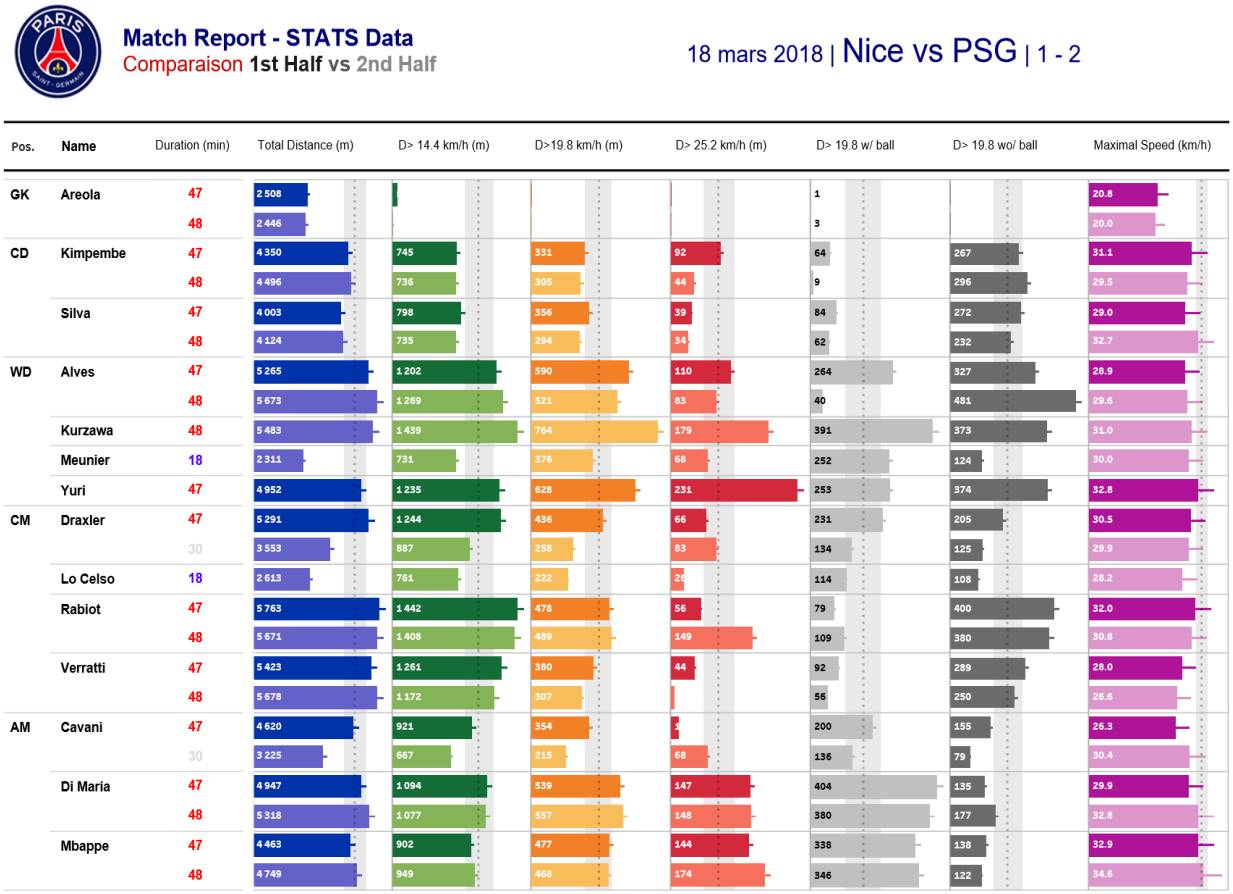

Every technical (action), tactical (decision), strategical (plan of action) and/or performance (effectiveness and efficiency) assessment, developed in the last unit, has to go hand in hand with solutions, so that the individual player and the whole team understand, in a general way, their complex background. Now that we know what has happened, we need to organize that information so as to share it with the players. One way to do it is by dividing them in groups or individually.

Figure 10: Comparison of physical, technical and expected goals (xG) values between two teams

Source: Stats Data, 2018 (Stats LLC).

Figure 11: Physical individual data, assessing the last two months efforts

Source: Stats Data, 2018 (Stats LLC).

- Group content:

  - Defensive aspects with global meaning, that influence the habitual operative strategy of all or part of the team. In the transmission process we present solutions for the spotted problems, that may be part of the content to work on during the following training sessions.

  - Build-up aspects with global meaning, that affect the future range of probabilities of victory, defining and presenting those general or group situations that need to be corrected through the presentation of possible solutions.

  - Circumstances related to build-up or defensive set pieces (SP) that have to be assess in front of the whole team.

  - Specific generalities that arise from that match and that may involve situations that produce stagnation or delay the strategic evolution of the team in the future.

- Aspects produced by the opponent that have exposed some weaknesses that we need to overcome, hide or minimize in the future.

- Positive reinforcements in relation to our defensive proposal that we need to consolidate for our game to evolve in the right direction.

- Reinforcements and outstanding facts of our build-up proposal that we need to include in our everyday operability. Improve our strengths to increase our chances of victory.

- Highlight those elements and aspects of the game that helped us achieve victory.

- Consolidate the concepts of team and group cohesion through achievement and success in the task.

- Highlight the aspects of our build-up play that have unbalanced the opponent.

- Highlight the aspects of our defensive play that have blocked the opponent's strengths.

- Individual content:

  - Personal mistakes that affect the area/work space where the player performs his tactical assignments.

  - Mistakes induced by the opponent that derive in our own unbalance, breaking the team's specific competitive dynamic.

  - Mistakes directly provoked by the opponent by outgrowing our player.

  - Specific game situations, where we intend the player to improve.

  - Individual challenges in which the player:

    - Prevailed over the opponent (highlighting the planned solutions).

    - Was overcome by the opponent (contributing with pertinent solutions).

  - Analysis of his competitive attitude, if appropriate, and contributions by the coach or staff members in that regard.

  - Expectations of immediate improvement for the future: We need to set clear, short-term objectives, asking ourselves, What is our priority for the short term in relation to the match played, and in contrast with his particular career until now? For this part we can use rubrics that are very useful to assess in a more objective way if there has been improvement or progress.

  - Analysis and assessment of the tracking identified through GPS and its contextualization in relation to his specific performance in the match.

B. Tools we have to do so.

Our objective is to determine which tools will be useful in this process.

- Team talks.
- Group talks - starting line-up, defenders, outside midfielders, forwards, etc.
- Individual conversations.
- Videos. We can share clips or whole matches with players - team, group, individuals - through platforms - Replayanalysis, Ilg, Hudl - without the need to download them. There is also the chance to show them through other platforms of data transmission - Wetransfer, MyAirBridge.
- Presentations.

C. Use of transmission tools.

In this respect, there are several aspects to reflect upon:

- Do we inform about strengths or weaknesses?

Coaches of the English youth selections prefer to share a balance of negative and positive points, so as to avoid the possible disadvantages of showing too many negative video sequences. (Groom, Cushion and Nelson, 2011).

In this sense, Groom and Cushion (2005) propose a ratio of positive-negative feedback 1:1, unless the team or individual lack confidence, in which case we will increase the positive feedback.

- Shall we transmit that information in groups or individually?

There are times when the intervention of the whole team may be necessary.

However, in cases where we intend to reinforce or correct group aspects, meeting only with the players involved will make this opportunity more valuable for them, and we may get a higher level of commitment.

In fact, if the feedback is for only one player, evidence suggests that there are some who tend to reject being analysed by the coach in front of the whole team, especially if their performance was not the expected one (Nelson, Potrac, Groom, 2014).

In some cases, individual video meetings may be enough to start the process of correcting certain aspects.

For example, let us imagine that in the previous match, the opponent took a great advantage of their build-up transitions, and produced counter attacks through direct movements with the forward. In the clips selected, we identify that our center backs were not doing defensive vigilances in the build-up phase, were late, allowed the forwards to turn, and that our forwards close to the loss were not doing the corresponding marked attack. In this context, having two sessions of short duration, one with the center backs

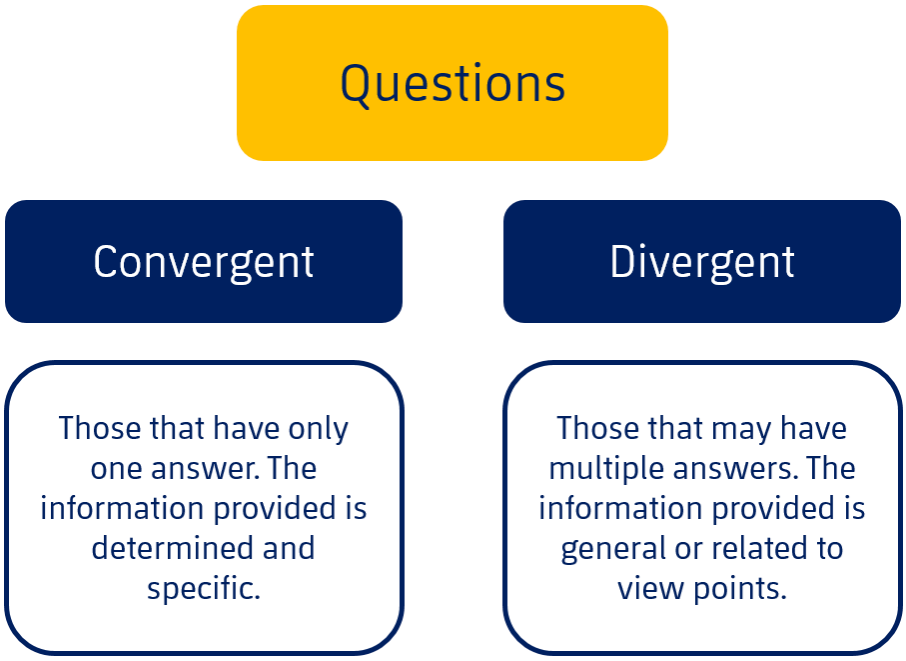

and another with the forwards, may be enough to solve this problem without the need to call other players to a meeting that does not concern them.

- How should we raise our questions?

According to Cushion, Harvey, Muir and Nelson (2012), the coach's questions can be classified in:

- Convergent, with answers or limited options.
- Divergent, with answers or limited options.

Figure 12: Classification of the coach's questions

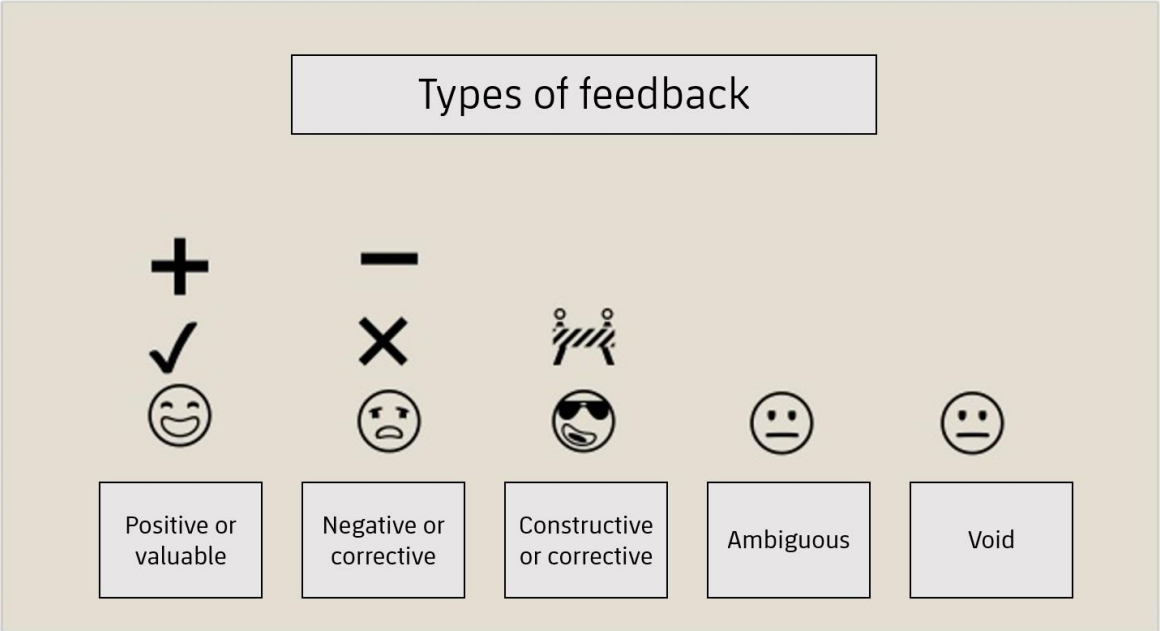

Source: [Image without title about Classification of the coach's questions]. 2013. Retrieved from https://bit.ly/2QAuJ79

- How should the feedback be?

Also, according to Cushion, Harvey, Muir and Nelson (2012), the feedback can be classified in:

- Positive. Statements that seek to reinforce or share information about correct behaviour.
- Negative. Statements that seek to disapprove of or share information about incorrect behaviour.
- Corrective. Statements that imply the solution for a similar future situation.

Figure 13: Types of feedback

Source: [Image without title about types of feedback], 2018, https://bit.ly/2SDS7Dv

Likewise, feedback can be more general or specific, depending on the player's previous knowledge. For example:

- It can be more general if we share a clip where we know that the player knows why he has taken a given decision.

- It should be more specific if the player seems uncertain about the suitability of an action, since we need to walk him along the reinforcement or correction process of that action.

Our aim here is not to favour some types of feedback or questions. We intend to highlight the idea that all of them are valid in certain situations, and there may be multiple ways into which they may be organized. It all depends on the situation and context we are in.

D. <u>When should we transmit the post-match analysis?</u>

There are multiple options to consider - immediately after the match, the following day, some days after, along the week, etc. - and they are all probably valid, as long as they are analysed and justified.

As a general guideline, the post-match analysis will be transmitted in the following working session after recovery from the match, that is, as soon as possible, so that the player has fresh in mind his situation during the match and he can contrast that with what the coach and the members of the staff share with him.

In this sense, there is a poll carried out by Wright, Carling, Lawlor and Collins (2016), where 35% and 58% preferred having the post-match session one or two days after the match, respectively. However, experience tells us that there are other equally valid alternatives.

We need to make sure that the emotional state is cool enough so that individual reasoning processes function without biases or pollutants from the competition and its consequences.

Let us imagine a week where, for certain - usually emotional - reasons, we are not interested in the players receiving post-match information at the beginning of the week.

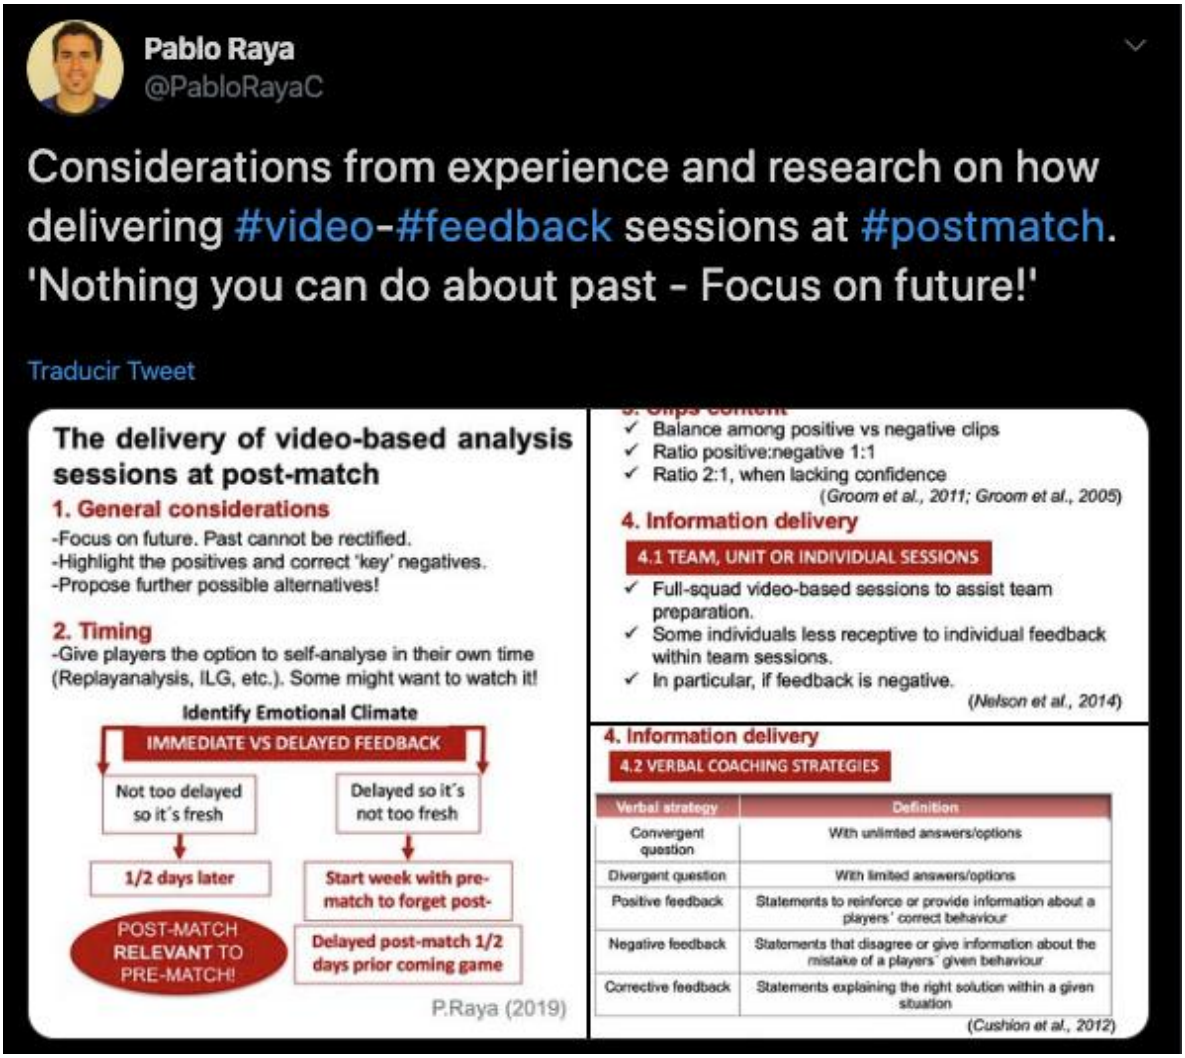

The alternative would be to start the week with the pre-match session or strategies to face the next encounter. In this way we can avoid, up to a certain extent, some players being affected by negative aspects of the previous match, so they can focus on improving aspects that may be important for the following match. Once the player's attention has been on the following match, at the end of the week we can have the post-match session.

Having this session at this point in time, is intended to reduce the effect of emotions on the subjective perception that the player has about himself, which makes it, also, more relevant, since it also addresses aspects related to the following match.

A good option is to call, at different times, those players that need a more personal assessment of their performance, may it be from the tactical and strategic perspective or from the psychological, emotional, conditional, etc. perspective.

In Figure 14 we share some content related to Pablo Raya (2019) published through Twitter.

Figure 14: Special considerations about the presentation of the post-match video analysis

Source: Raya, 2019, https://bit.ly/2QFiBSe

E. Who is the person in charge of transmitting this analysis?

It is essential to consider this aspect at this point. It is known that each player will receive information differently depending on who his interlocutor is. It is not the same that the reinforcement or the correction comes from the first coach than from other member of the staff (assistant coach, physical trainer, analyst, goalkeeper's coach, etc.). Each one of them has different ways of conveying the message, and they embody different roles for each player.

As analysts, we can shed some light on this issue, since the psycho-social aspects are part of our training. Let us not forget that one of our objectives is helping the group develop a deep self-knowledge.

Taking care of this issue may make the difference between a message understood the way we want it to, or not.

Summing up the process described in these first three modules of the course, we can state that:

- In the pre-match we look for clues and recurrences in the opponent's behaviour.
- During the match we confirm certain predictions about reality.
- In the post-match we assess the impact as well as our responses.

Uncertainty marks the reality of the game (Couto Lago, 2019)
